Discuss

How do you manage different file versions ?

How do you work with collaborators on the same files ?

•

Notions of code versioning

Track the history and evolution of the project think of it as a series of snapshots (commits) of your code

Benefits:

team work

tracking bugs & recovering from mistakes

Different usage:

local

client-server (SVN)

distributed (Git)

What is Git ?

Version control system Manage different versions of files Collaborate with yourself

Collaborate with other people

Why use Git

"Always remember your first collaborator is your future self, and your past self doesn't answer emails"

→ Christie Balhai

• • •

What is Git good for ?

Local

Backup, reproducibility

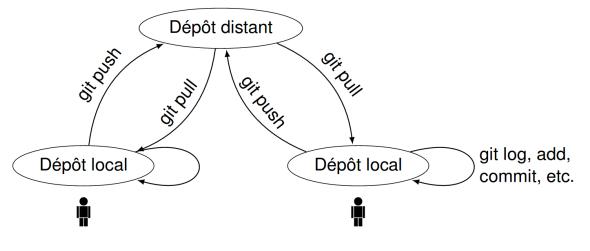

What is Git good for ?

Client-Server

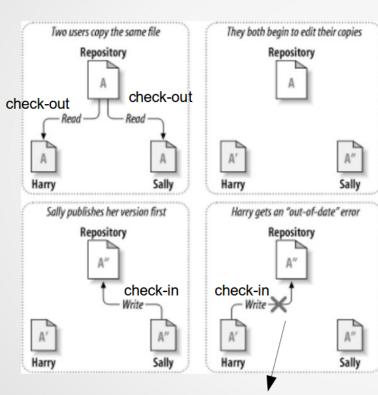

Backup, reproducibility, collaboration

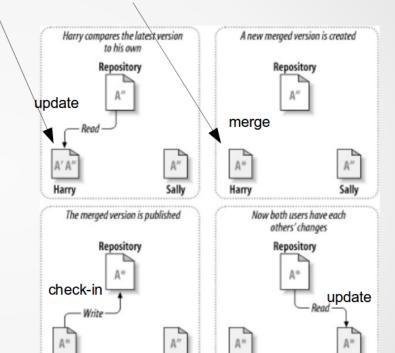

Dépôt commun distant (Gitolite, Redmine, FusionForge, *GitHub*)

Limitation

Sally

Harry

copy-modify-merge solution

Harry

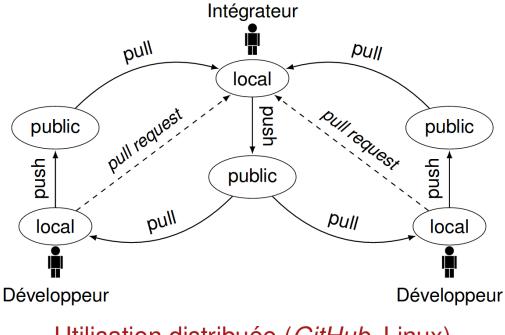

Sally

What is GIT good for ?

Distributed

Backup, reproducibility, collaboration, transparency

Difference between Git & GitHub?

Git is the version control system service
Git runs local if you don't use GitHub
GitHub is the hosting service, a website
on which you can publish (push) your Git repositories and collaborate with other people
It provides a backup of your files
It gives you a visual interface for navigating your repos
It gives other people a way to navigate your repos
It makes repo collaboration easy (e.g., multiple people contributing to the same project)

- It provides a lightweight issue tracking system

•

... and GitLab vs GitHub vs others

GitLab is an alternative to GitHub

GitLab is free for unlimited private projects. GitHub doesn't provide private projects for free

And for ELIC, Gogs does the job

•

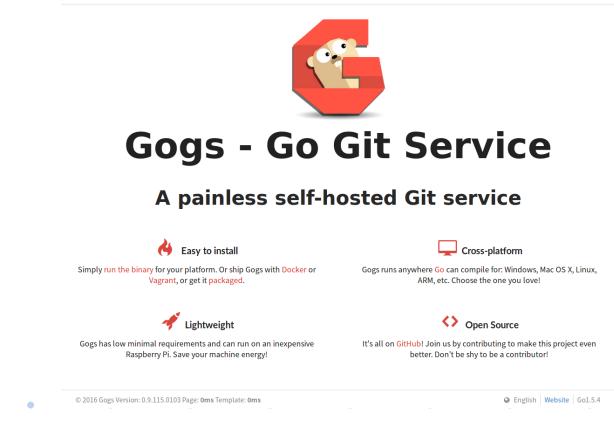

shares the same features (Dashboard, File browser, Issue tracking, Groups support, Webhooks, etc)
easy to install, cross-platform friendly,
uses little memory, uses little CPU power
... and 100% free

Gogs: http://www.climate.be:3000

F Sign In

UCL - ELIC

Simple guide for getting started

Checkout a remote repository

create a local working copy of a remote repository by running the command

git clone ssh://git@www.climate.be:3022/TECLIM/Git_Training.git

Add & commit

You can propose changes (add it to the Index) You can commit these changes to the HEAD

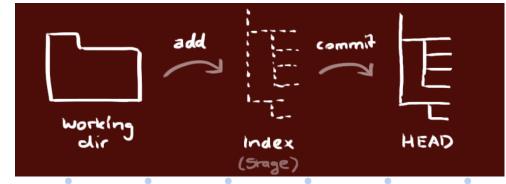

git add <filename>

git commit -m "Commit message"

Git workflow

- Your local repository consists of three "trees" maintained by git
 - the first one is your **Working Directory** which holds the actual files
 - the second one is the **Index** which acts as a staging area and finally the **HEAD** which points to the last commit you've made

Simple guide for getting started

Pushing changes

Your changes are now in the HEAD of your local working copy. To send those changes to your remote repository

git push

Update

to update your local repository to the newest commit, execute

git pull

in your working directory to fetch and merge remote changes.

• • •

Replace local changes

In case you did something wrong, which for sure never happens ;), you can replace local changes using the command

git checkout -- <filename>

• • • • •

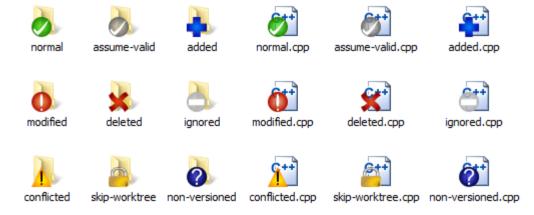

this replaces the changes in your working tree with the last content in HEAD. Changes already added to the index, as well as new files, will be kept

Windows users

How commonly do programmers use Git GUIs instead of the command line?

use programs like SourceTree or TortoiseGit

But, to be familiar with Git, try the command line (clone, push/pull, merge, rebase, log, tag, formatpatch/am; bisect, blame, etc).

Simple Git Exercices

First, configure your environment (just once) (on your laptop, on your ELIC account, etc)

git config --global user.name "Your Name" git config --global user.email "foo@bar.be" git config --global color.ui auto

Now, clone http://www.climate.be:3000/TECLIM/Git_Training Theses are very simple exercices to learn to manipulate git. In each folder, simply run ./create.sh and follow the guide ;)
